

sgapiResultsQuestionTotal(%%questionID)

Last Modified on 08/06/2014 1:22 pm EDT

This returns the cumulative sum of all the numeric values answered for the given question ID from *responses that have already been processed*.

This function requires numeric reporting values. The sum that is returned will not include data from any responses that haven't been processed; this includes the current response when the script is run. For instance, if you ask, in a textbox question, for the number of guests this function can be used to get a total number of guests entered so far by all previous respondents whose responses have been processed.

Example

In this example, we display the sum of all numbers entered into the question with ID 2.

[Check it out in an Example Survey](#)

```
%%output .= 'Total meals ordered: '.sgapiResultsQuestionTotal(2);
```

Output would be: Total meals ordered: 6
