

# sgapiGetQueryResponseCount(%%urlname)

*Last Modified on 08/06/2014 1:22 pm EDT*

This function returns the number of responses (completes) that have been collected for the current survey. It takes an optional %%urlname parameter that filters by a URL variable. %%name should be in the format of: "urlvar\_VariableName=Value".

## Example

In this example, we return the number of completed responses with the url variable "location=Denver". URL variable needs to be configured manually, either through the link creation menu, email campaign system, or some other means.

```
%%name = "urlvar_location=Denver";  
%%output .= sgapiGetQueryResponseCount(%%name);
```
